

Perfume Formula Manager UI

I want you to act as a senior UX designer, perfumer, and full-stack software engineer.

Design a modern web application for creating and organizing perfume formulas. The application should feel like a professional creative tool, similar to Figma, Notion, or Ableton Live, rather than a spreadsheet.

Goal

The application should organize fragrance materials automatically while helping me formulate artistic perfumes.

I want the software to understand perfumery concepts, not simply store ingredients.

Core Features

Ingredient Library

Create a searchable database of raw materials.

Each ingredient should contain:

- Name
- CAS Number (optional)
- Supplier
- Dilution %
- Maximum IFRA recommendation (optional)
- Cost per gram
- Density
- Evaporation class
- Perfume note
 - Top
 - Middle
 - Base
 - Transitional
- Olfactive family
- Description
- Strength (1-10)
- Tenacity
- Diffusion
- Color tag

Each ingredient should support multiple tags.

Example:

Iso E Super

Tags:

- Woody
- Amber
- Cedar
- Musky
- Transparent
- Modern

Melonal

Tags:

- Marine
- Ozonic
- Watermelon
- Fresh
- Green
- Aquatic

Delta Decalactone

Tags:

- Coconut
- Milky
- Creamy
- Peach
- Tropical
- Lactonic

Formula Builder

The main screen should behave almost like a DAW or design canvas.

A formula contains:

Ingredient Weight Percentage Drops (optional) Role Notes

As ingredients are added, the software automatically:

- Calculates percentages
 - Calculates total weight
 - Calculates concentrate %
 - Calculates dilution
 - Warns when IFRA limits are exceeded
-

Automatic Note Organization

Instead of one long ingredient list, automatically organize ingredients into sections.

TOP NOTES

Middle Notes

Base Notes

Transitional Notes

The ingredient's stored evaporation class determines where it appears.

Allow manual override.

Automatic Accord Detection

As ingredients are added, detect accords.

For example

Iso E Super Cashmeran Cedramber

↓

Woody Accord

Melonal Helional Calone

↓

Marine Accord

Ethyl Maltol Vanillin Delta Decalactone

↓

Creamy Gourmand Accord

Display these as colored badges.

Automatic Scent Tags

The software should calculate an overall scent profile.

Example output:

Woody 82%

Musky 60%

Marine 42%

Amber 38%

Creamy 29%

Green 20%

Fruity 18%

Metallic 12%

Ozonic 10%

The percentages should be estimated using weighted ingredient percentages and tag strength.

Display this as horizontal bars.

Formula Analysis Panel

On the right side, include an intelligent analysis panel.

It should describe the perfume like an experienced perfumer.

Example:

"This formula is predominantly woody and transparent with moderate diffusion. The base is strong and long lasting due to Iso E Super and Cashmeran. The top is relatively weak and could benefit from additional volatile citrus or aldehydes."

It should identify:

- weak openings
 - overly heavy bases
 - imbalance
 - lack of transition
 - excessive sweetness
 - poor longevity
 - poor diffusion
 - dominant materials
-

Accord Builder

Allow creation of reusable accords.

Example

"Cold Milk"

40% Delta Decalactone

20% Ethyl Maltol

20% Vanillin

20% Heliotropin

Save as Accord

Later insert accord into any perfume.

Ingredient Relationships

Clicking an ingredient opens a side panel.

Display:

Pairs well with

Common combinations

Conflicts

Popular ratios

Example perfumes using it

Materials that boost diffusion

Materials that soften it

Materials that replace it

Visual Design

The interface should be minimal and modern.

Inspired by

- Notion
- Figma
- Arc Browser
- Linear
- Apple Logic Pro

Lots of whitespace.

Rounded cards.

Subtle gradients.

Soft neutral colors.

No skeuomorphic bottles or decorative perfume imagery.

The software should feel like a serious creative tool.

Smart Search

Typing

milk

should suggest

Delta Decalactone

Milk Lactone

Butter CO2

Vanillin

Typing

woody

should return all woody materials.

Typing

fresh tropical

should search ingredient tags.

AI Assistant

Include an AI perfumer assistant.

Examples:

"Make this more transparent."

"Increase longevity."

"Reduce sweetness."

"Make it smell like humid tropical air."

"Give it a Frutiger Aero vibe."

The AI should suggest ingredient substitutions and percentage adjustments while explaining why.

Technology

Generate this as a responsive React application using:

- React
- TypeScript
- Tailwind CSS
- shadcn/ui
- Framer Motion
- Recharts for visualizations
- Local storage initially, with architecture ready for a future database

Use clean component architecture, reusable hooks, and mock ingredient data to demonstrate functionality.

Focus on creating a polished, interactive prototype with realistic sample ingredients, automatic note classification, tag-based analysis, accord detection, and an intuitive workflow suitable for both beginner and advanced perfumers.
